

Explore the future beyond LTE ? Self Organizing Networks

Facing today's rapid explosion of data growth, and the growth of LTE networks, how do we find a way to automate the networks in a fast, safe and flexible fashion, and at the same time cut down networks operation costs without compromising quality?

Self Organizing Networks (SON) has increasingly become a key role in achieving these priorities.

ComSoc invites distinguished instructor and expert on SON technology, [Javan Erfanian](#) to offer a power packed one day online course on **12 February 2013 from 9:00 am - 4:30 pm EST.**

Self Organizing Networks: ?Within an End-to-End LTE / LTE-Advanced Roadmap

Participants will learn about how Self Organizing Networks are playing a role in the current and emerging LTE landscape, walk through the definition of Self Organizing Networks (SON), how to identify its drivers, gain in-depth understanding of the SON Technologies including Self-

Configuration, Self-Optimization, Self-Healing, and Self-X.

Course will also focus on Development of SON Requirements & Standardization (NGMN, 3GPP), SON in the End-to-End Technology Paradigm Evolution (Dynamic, Seamless, Reconfigurable, Virtualized / Cloud-Based), and the SON Reality - Ecosystem Maturity, Realizations, What to Expect Next.

Are you ready to explore the future beyond LTE? This course will bring you the latest in research and development around SON, and provide the roadmap to your strategic decisions for the network solutions. You don't want to miss out!

[Register today!](#)

Course participants also qualify for 0.6 IEEE CEUs, and will receive a Certificate for attending the course.
